

Codex in Cursor: the starting layout

In this demo workspace, Codex started collapsed beneath Explorer.

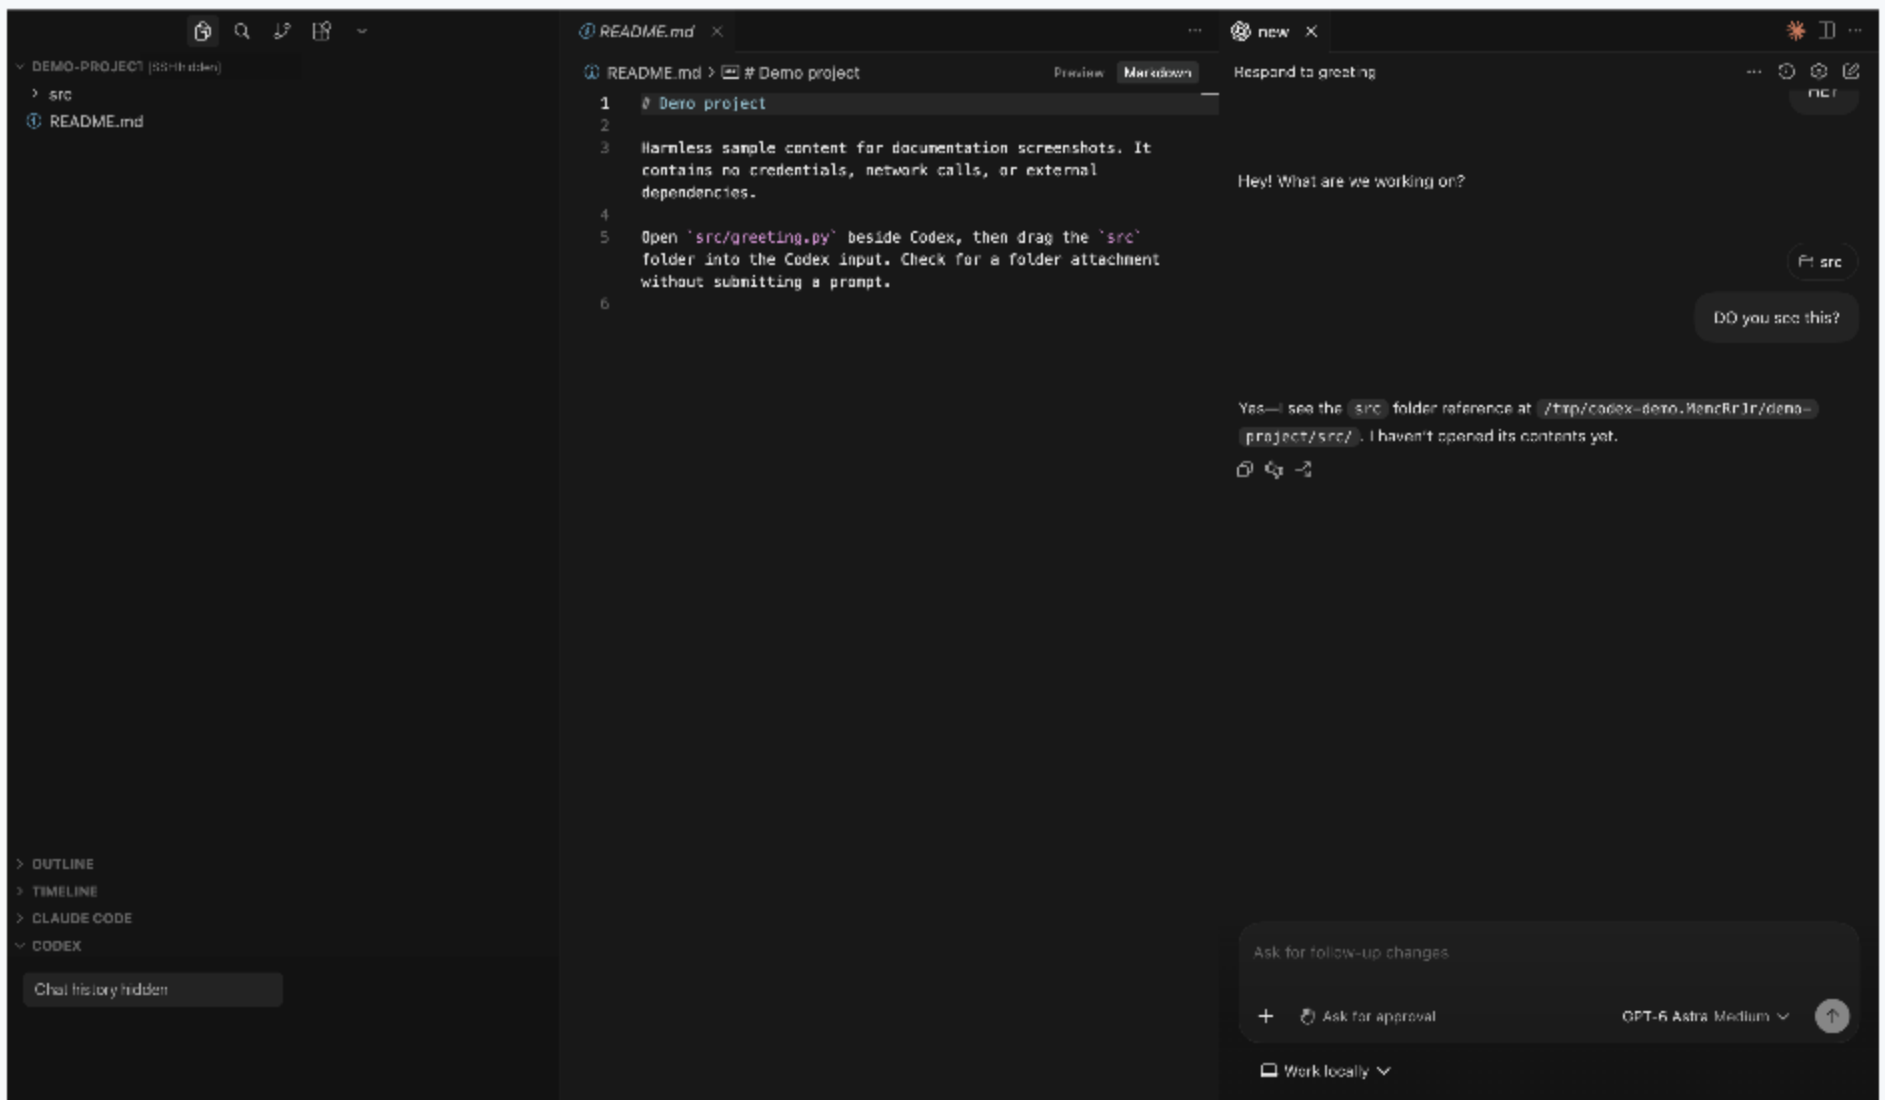

Codex is in the left sidebar.

Real demo capture. This compares workspace layouts; the folder patch was present in both views.

Codex beside your code

A full-height pane on the right.
The companion opens it at startup.

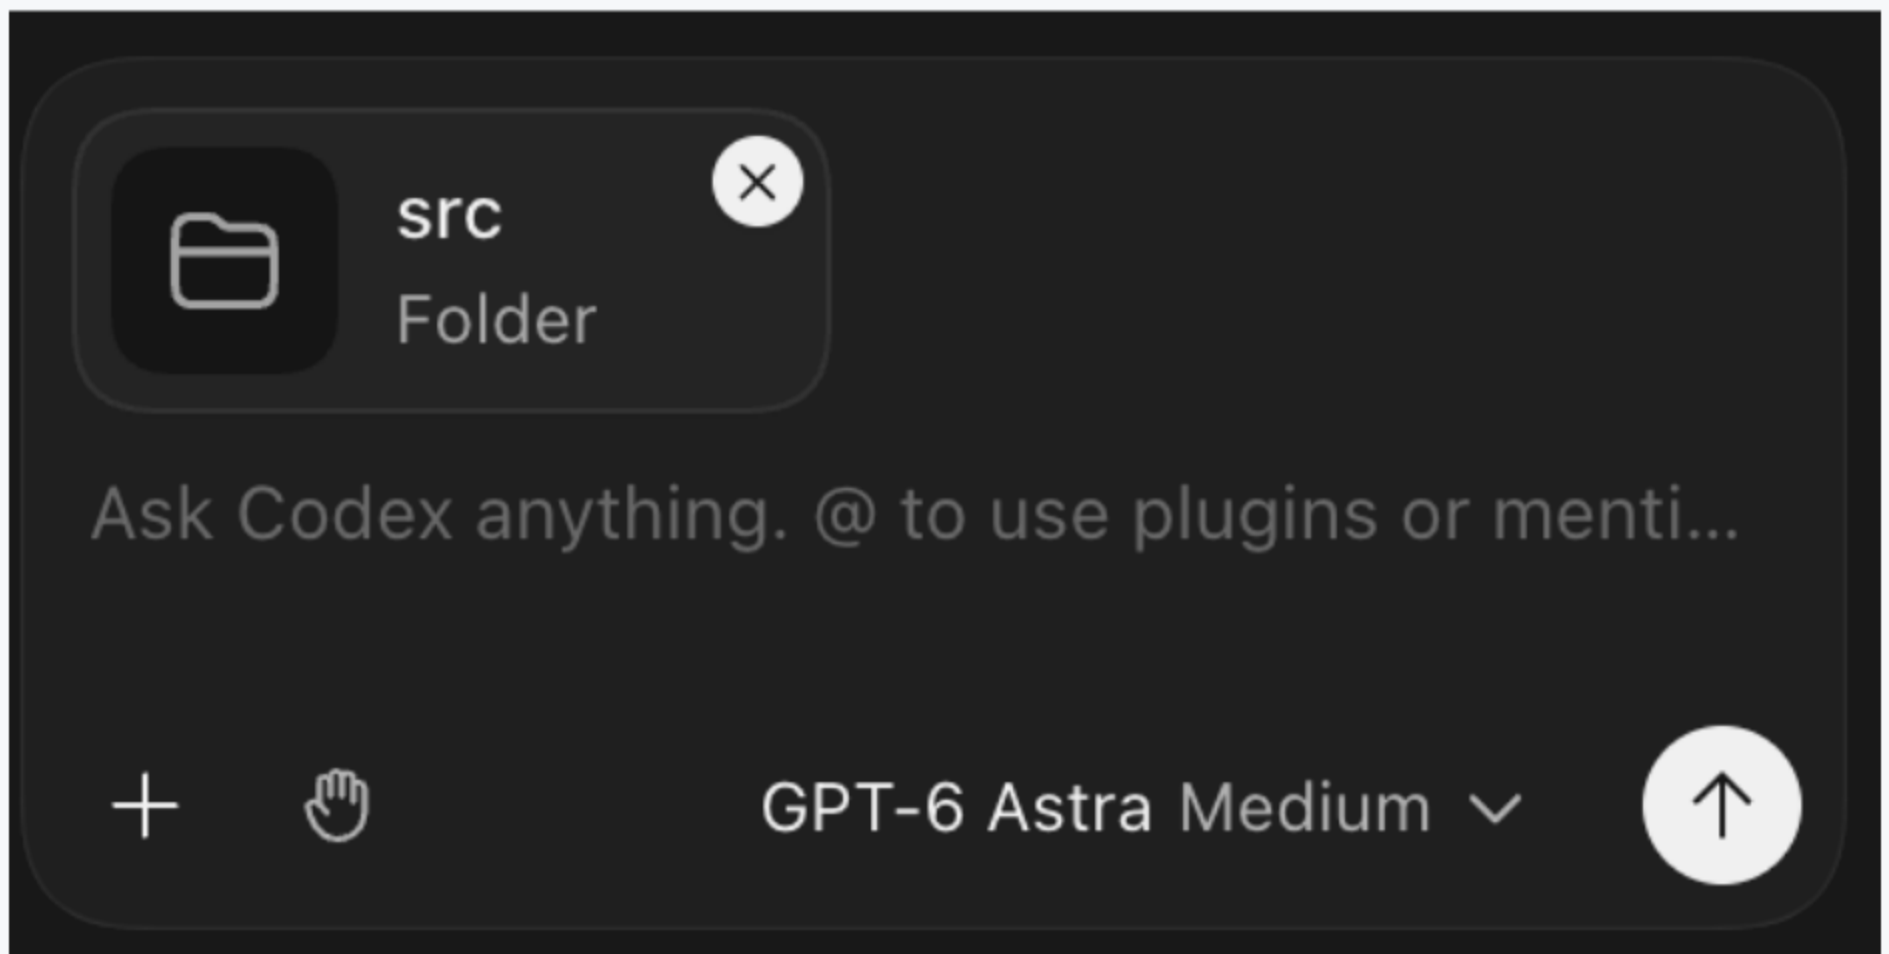

Your files and Codex, in one window.

Same demo workspace. Layout shown was arranged manually; automatic startup was verified separately.

A folder attached with one drag

Drag src from Explorer into Codex.
It appears as a Folder attachment.

A folder reference, ready for your next request.

Fresh session on a second Linux SSH devbox.
The check did not send a message.

An experimental preview you can try

Open source · MIT License

Downloadable pane extension, folder support, and setup instructions for you or your agent.

Supported preview builds

Cursor 3.18.25 on macOS

Codex 26.901.22334 on Linux x64 over SSH

Folder support modifies Cursor files and triggers its integrity warning. Read the setup and rollback guide before installing; updates may overwrite the patch.
